(54) Abstract Title

Polymerizable chiral dopants based on chiral tetrahydrofuran or hexahydrofuro[3,2-b]furan substituted by at least two mesogenic groups

Chiral compounds are disclosed of the formula

 $(Z-Y-[A]_m-Y-M-Y-)_n X$ 1,

where, independently of one another,

is a spacer,

is a mesogenic group containing two phenylene radicals which are unsubstituted or substituted by C_1 -М to C₄-alkyl, methoxy, ethoxy, fluorine, chlorine, bromine, C₁- to C₂₀-alkoxycarbonyl or C₁- to C₂₀-alkylcarbonyl and are linked via O, CO, OCO, OCOO or COO,

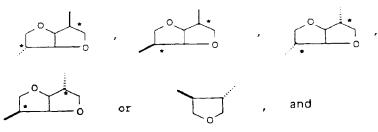

is a direct bond, O, S, COO, OCO, OCOO, CON(R) or N(R)CO, and

is a polymerizable group, Z

is 0 or 1, m

is from 2 to 6, and n

is a chiral radical of the formula

ien. +on i alkyl or hydrogen

en ser to a to about inestencinquia (Tystais 1 - prime - prim in optical polarizers and optical filters

Polymerizable chiral compounds, and their use

- It is known that molecules which are anisotropic in shape can 5 form liquid-crystalline phases, known as mesophases, on warming. The individual phases differ through the spatial arrangement of the major parts of the molecules on the one hand and through the molecular arrangement with respect to the long axes on the other hand (G.W. Gray, P.A. Winsor, Liquid Crystals and Plastic
- 10 Crystals, Ellis Horwood Limited, Chichester 1974). The nematic liquid-crystalline phase is distinguished by the fact that there is only one alignment long-distance ordering due to the long molecular axes lining up in parallel. Under the prerequisite that the molecules making up the nematic phase are chiral, a
- 15 cholesteric phase forms, in which the long axes of the molecules form a helical superstructure perpendicular thereto (H. Baessler, Festkörperprobleme XI, 1971). The chiral moiety may be present either in the liquid-crystalline molecule itself or added to the nematic phase as a dopant. Phases produced by doping are referred
- 20 to as induced cholesteric phases. This phenomenon was first studied on cholesterol derivatives (H. Baessler, M.M. Labes, J. Chem. Phys. 52 (1970) 631; H. Beassler, T.M. Laronge, M.M. Labes. J. Chem. Phys. 51 (1969) 3213; H. Filkelmann, H. Stegemeyer, Z. Naturforschg. 28a (1973) 799). It later also became possible to
- 25 induce cholesteric phases by adding other chiral substances which are not themselves liquid-crystalline (H. Stegemeyer, K.J. Mainusch, Naturwiss. 58 (1971) 599; H. Finkelmann, H. Stegemeyer, Ber. Bunsenges. Phys. Chem. 78 (1974) 869).
- 30 The cholesteric phase has remarkable optical properties: large optical rotation and pronounced circular dichroism caused by selective reflection of circular-polarized light within the cholesteric layer. The different colors observed depending on the veering angle depend on the pitch of the helical superstructure,
- 35 which is itself dependent on the twisting power of the chiral component. The pitch and thus the wavelength range of the selectively reflected light of a cholesteric layer can be varied, in particular, by changing the concentration of a chiral dopant (J.E. Adams, W.E.L. Haas, Mol. Cryst. Lig. Cryst. 16 (1972) 33).
- 40 Such cholesteric systems offer interesting opportunities for practical use. Thus, incorporation of chiral moieties into mesogenic acrylic esters after alignment in the cholesteric phase and photocrosslinking allows the production of a stable, colored

Chem. 187 (1986) 189). Furthermore, admixing of non-crosslinkable, chiral compounds with nematic acrylic esters

allows, after photocrosslinking, the production of a colored polymer (I. Heyndericks, D.J. Broer, Mol. Cryst. Liq. Cryst. 203 (1991) 113), but this still contains volatile constituents which are prohibitive for use.

5

EP-A-739403 describes chiral compounds which firstly have a high twisting power and secondly can be incorporated into the cholesteric phase in a stable manner in any desired concentration without diffusing or crystallizing out of the phase.

10

We have now found a group of compounds which has even better properties than those described above.

Accordingly, the present invention provides compounds of the 15 formula I

$$(Z-Y-\{A\}_m-Y-M-Y-)_n X I,$$

where, independently of one another,

20

25

A is a spacer,

is a mesogenic group containing two phenylene radicals which are unsubstituted or substituted by C_1 - to C_4 -alkyl, methoxy, ethoxy, fluorine, chlorine, bromine, C_1 - to C_{20} -alkoxycarbonyl or C_1 - to C_{20} -alkylcarbonyl and are linked via 0, CO, OCO, OCOO or COO,

Y is a direct bond, O, S, COO, OCOO, COO(R) or N(R)CO, and

z is a polymerizable group,

30 m is 0 or 1,

n is from 2 to 6, and

X is a chiral radical of the formula

 \mathbb{R} is C_1 - to C_4 -alkyr or hydrogen.

The spacer A can be any group known for this purpose; the spacers are usually linked to X via ester or ether groups or a direct bond. The spacers generally contain from 1 to 30, preferably from 1 to 12, carbon atoms and may be interrupted in the chain by, for 5 example, O, S, NH or NCH₃. Suitable substituents for the spacer chain are fluorine, chlorine, bromine, cyano, methyl and ethyl.

Examples of representative spacers are the following:

10 (CH₂)_p, (CH₂CH₂O)_qCH₂CH₂,

$$CH_3$$
 CH_3 CH_3 CH_3 CH_2 $(CH_2CHO)_{a-}CH_2CH$ or $(CH_2)_{6}CH$

15

where

p is from 1 to 12, and

q is from 1 to 3.

20 Particularly preferred mesogenic groups M are, for example:

35

The groups necessary for the novel compounds are linked to one another via bridges Y, such as O, S, COO, OCOO, OCOO, CONE, NHCO, CON(R), N(R)CO or a direct bond, where R is C_1 - to C_4 -alkyl or hydrogen. Y is preferably O, OCO, COO or OCOO.

40

n is preferably 2.

45 compounds, vinyl ethers and styrene derivatives. Epoxides are also suitable.

Examples of preferred radicals Z are the following:

,
$$\equiv$$
 , $CH_2=CH-CH_2$, CO_2R

$$CH_3$$
 $C1$ and , where R is as defined above.

z is particularly preferably $CH_2=CH-$, $CH_2=C-$ or $CE_2=CH-CH_2$.

10

35

- 15 The units $Z-Y[A]_m-Y-M-Y$ according to the invention, where Z, Y, m, A and M are as defined above, can be obtained by generally known synthetic methods, as described, for example, in EP-A 739403 and DE-A 39 17 196.
- 20 The chiral moieties can be purchased commercially and are thus available.

The novel compounds are suitable as high-twisting-power dopants for producing cholesteric liquid crystals. Using very small amounts, the reflection wavelength of the cholesteric mixture can be shifted into the visible region. It is advantageous here that the dopants form a stable mixture with the nematic host system, from which mixture the dopant does not crystallize out. The novel compounds are particularly suitable for this purpose.

The novel compounds are particularly suitable for use in electro-optical display elements or as chiral dopants for nematic or cholesteric liquid-crystal mixtures for producing layers which reflect in color.

The novel compounds are also suitable for use as chiral dopants in optical polarizers and optical filters.

Particular preference is given here to mixtures of the novel 40 compounds with nematic compounds of the formula

$$(Z)_{m}-Y-A-Y-M^{1}-Y-A-Y-(Z)_{m}$$
 II

the above of the area.

Compounds of the formula II are described, for example, in DE-OS 195 32 408, GB-A-22 79 659, (EP-A-749 466) and EP-A-648 827.

5 Also claimed are solid compositions comprising the novel compounds in copolymerized form.

Also claimed are solid compositions comprising the novel compounds and nematic compounds of the above formula II, in each 10 case in copolymerized form.

Solid compositions of this type may be, for example, polymers which can contain partly uncrosslinked or non-copolymerized constituents. Non-copolymerized constituents of this type can be,

- 15 for example, unreactive organic molecules having a wide variety of molecular weights or alternatively inorganic or organic pigments. They may furthermore also be additives, for example rheology auxiliaries or light and/or oxidation stabilizers.
- 20 It is of course also possible for solid compositions of this type to be the polymerization products of the claimed liquid-crystalline mixtures containing the novel compounds, and of the claimed liquid-crystalline mixtures containing nematic compounds of the above formula II in addition to the novel compounds.

Mixtures with liquid-crystalline substances

Example 49

 $5 \times \text{mol}$ % of Example 1 are dissolved in the nematic mixture

by mixing the melts. After cooling to RT, cholesteric phases with the following reflection wavelengths - depending on ${\tt X}$ - are 25 obtained:

	x (mol%)	λ⊥ (nm)	
	2.0	701	
30	3.0	482	
	4.0	341	

Example 50

x mol% of Example 1 are dissolved in the nematic compound 35

Cost - Carolwains . . . Carolina

x (mol%)	λ± (nm)	
3.05	660	
3.51	565	
5 4.28	465	
5.46	365	

Example 51

x mol% of Example 1 are dissolved in the nematic mixture

by mixing the melts. After cooling to RT, cholesteric phases with the following reflection wavelengths - depending on ${\tt X}$ - are obtained:

λ⊥ (nm)
854
696
575
498

Example 52

x mol% of Example 1 are dissolved in the nematic mixture

by mixing the melts. After cooling to RT, cholesteric phases with the following reflection wavelengths - depending on X - are 25 obtained:

	x (mol%)	λ⊥ (nm)
	1.5	974
	2.0	736
30	2.5	588
	3.0	493

Comparative Example 53

 $_{4 \text{ mol}\$}$ of both the compound from Example 1 and the compound of the formula III (corresponding to EP-A-739 403)

40

are added to the nematic compound

20 The two substances are melted and their spectrum measured at RT. The compound from claim 1 gives a reflection at 431 nm, while the compound of Formula III gives a reflection at 1087 nm.

Claims

$$(Z-Y-[A]_m-Y-M-Y-)_nX$$

I,

where, independently of one another,

- 10 A is a spacer,
 - is a mesogenic group containing two phenylene radicals which are unsubstituted or substituted by C_1 to C_4 —alkyl, methoxy, ethoxy, fluorine, chlorine, bromine, C_1 to C_{20} —alkoxycarbonyl or C_1 to C_{20} —alkylcarbonyl and are linked via 0, CO, OCO, OCOO or COO,
 - Y is a direct bond, O, S, COO, OCO, OCOO, CON(R) or N(R)CO, and
 - z is a polymerizable group,
 - m is 0 or 1,
- 20 n is from 2 to 6, and
 - X is a chiral radical of the formula

- 35 R is C_1 to C_4 -alkyl or hydrogen.
 - 2. A compound as claimed in claim 1, where n = 2.
- 3. A compound as claimed in claim 1, where M is

- 10 4. A compound as claimed in claim 1, where
 Y is 0, 0CO, COO, 0COO or a direct bond.
- 5. A compound as claimed in claim 1, where

Z is
$$CH_2=CH$$
—, CH_2
 CH_3
or $CH_2=CH$ — CH_2 .

20

6. A compound as claimed in claim 1, where

p is from 1 to 12 and q is from 1 to 3.

7. A compound as claimed in claim 1, where

- 8. A compound as claimed in claim 1 and referred to in any of the foregoing Examples 1 to 52.
- A liquid-crystalline mixture comprising one or more compounds as claimed in any of claims 1 to 8.
- 5 10. A liquid-crystalline mixture comprising one or more compounds as claimed in any of claims 1 to 8 and one or more nematic compounds of the formula II

 (Z) -Y-A-Y-M¹-Y-A-Y-(Z) , II

where, in each case independently of one another, A, m, Y and Z are as defined in claim 1, and M^1 is a mesogenic group.

- 11. A solid composition comprising a compound as claimed in any of claims 1 to 8 in copolymerized form.
- 12. A solid composition comprising a compound as claimed in any of claims 1 to 8 and a nematic compound of the formula II defined in claim 10, in each case in copolymerized form.
- 13. The use of a compound as claimed in any of claims 1 to 8 in electro-optical displays or as a chiral dopant for nematic or cholesteric liquid crystals for producing layers which reflect in color.
 - 14. The use of a compound as claimed in any of claims 1 to 8 as a chiral dopant in optical polarizers and optical filters.
